Triadic Casimir — Fourier Atlas v0.3.9 Framework Report

SST Workbench / Unregistered instance

October 19, 2026

1 Instance identity

A065-v0.3.9 source-native-core adapter qualification instance.

2 Research question

Does a preregistered triadic clock/stress geometry pilot satisfy its analytic controls while independent physical coupling gates remain unresolved?

3 Null and alternative hypotheses

No independently qualified source-specific physical two-surface response is established by the present geometry and toy models.

4 Explicit assumptions

Time-dependent regularized filament RK4 is exploratory and is not full Euler closure.

5 Definitions

u material velocity; omega=curl u; S symmetric strain.

6 Analytical equations

The official AUTO_SCIENCE_CONTRACT fragment records frozen equations.

Machine-readable science contract

Research question Does a preregistered triadic clock/stress geometry pilot satisfy its analytic controls while independent physical coupling gates remain unresolved?

Objective Independently verify three dataset seals, analytic Euler/gauge/sheet controls and one sourced KnotPlot trefoil finite-core geometric response without importing target force.

H_0 No independently qualified source-specific physical two-surface response is established by the present geometry and toy models.

H_1 Independently qualified PKLSA Euler motion, boundary conditions and microscopic link coupling produce held-out physical predictions.

Registered equations

E1: Incompressible Euler kinematics

$$\nabla \cdot \mathbf{u} = 0, \quad \boldsymbol{\omega} = \nabla \times \mathbf{u} \tag{1}$$

Dimensional check: divergence and vorticity both inverse seconds

E2: Pressure Poisson source

$$\nabla^2 p = \rho_M(\frac{1}{2}|\omega|^2 - ||S||_F^2) \tag{2}$$

Dimensional check: kg/(mˆ3 sˆ2) on each side

E3: Regularized geometric velocity diagnostic

$$\mathbf{u}(\mathbf{x}) = \frac{1}{4\pi}\sum_j \frac{\Delta\mathbf{X}_j \times (\mathbf{x} - \mathbf{X}_{j+1/2})}{(|\mathbf{x} - \mathbf{X}_{j+1/2}|^2 + \varepsilon^2)^{3/2}} \tag{3}$$

Dimensional check: dimensionless Gamma=1 geometry diagnostic

E4: Profile-dependent cross-sectional enstrophy inverse

$$Z_G = \Gamma^2/(2\pi a^2), \quad Z_R = \Gamma^2/(\pi a^2) \tag{4}$$

Dimensional check: Gammaˆ2/Z = Lˆ2 for SI cross-section

E5: Rosenhead regularization swirl and steady radial pressure balance

$$v_{RM} = \Gamma r/(2\pi(r^2 + \varepsilon^2)), \quad \partial_r p = \rho v_\theta^2/r \tag{5}$$

Dimensional check: pressure gradient M/(Lˆ2 Tˆ2)

E6: 3D Gaussian-smoothed closed vortex current

$$\boldsymbol{\omega}(\mathbf{x}) = \Gamma \oint_C e^{-|\mathbf{x}-\mathbf{X}|^2/a^2}\, d\mathbf{X}/(\pi^{3/2}a^3) \tag{6}$$

Dimensional check: omega 1/T if Gamma Lˆ2/T

E7: Local cross-section core inference under Gaussian profile

$$\Gamma_\perp = \int_\Sigma \omega_\parallel dA, \quad Z_\perp = \int_\Sigma \omega_\parallel^2 dA, \quad a_G = |\Gamma_\perp|/\sqrt{2\pi Z_\perp} \tag{7}$$

Dimensional check: Gammaˆ2 / Z = Lˆ2

E8: Periodic velocity and Poisson pressure diagnostics

$$\hat{\mathbf{u}} = i\mathbf{k} \times \hat{\boldsymbol{\omega}}/|\mathbf{k}|^2, \quad \nabla^2 p = -\rho \partial_i u_j \partial_j u_i \tag{8}$$

Dimensional check: periodic numerical diagnostics only

Registered code-to-mathematics steps

1. **S1** [G1; equations E1]: Verify all three source seals before any scientific result is evaluated
2. **S2** [G2; equations E2, E3]: Evaluate analytic Euler controls and preregistered trefoil geometry resolution scan
3. **S3** [G3; equations E3]: Withhold physical Casimir claims without independent providers, wall dynamics, and atom-link normalization
4. **S10** [G15; equations E3]: Verify direct parametric XYZ N600 to N4800 hashes and nesting
5. **S11** [G16; equations E3]: Independent fixed-core 1 percent spatial convergence at baseline epsilon=0.12 across BOTH historical trefoils

6. **S12** [G17; equations E3]: Report eps 0.06 0.12 0.24 numerical core sensitivity without physical force normalization
7. **S13** [G18; equations E3]: Check C++17 1200 and 4800 time step refinement and Python N150 parity
8. **S7** [G12; equations E3]: Audit historical Fourier and torus XYZ hash and analytic geometry
9. **S8** [G13; equations E3]: Compare reduced vortex filament RK4 spatial/time resolution on independent geometric seeds
10. **S9** [G14; equations E3]: Report fixed core regularization sensitivity without physical force interpretation
11. **S4** [G10; equations E3]: Verify fixed-core 150/300/600 convergence, separately retaining original G2 failures
12. **S6** [G3; equations E1, E2, E3]: Evaluate G3 only after precommitted G1+G10 and temporal/analytic guard; retain G2=FAIL and physical UNRESOLVED
13. **S5** [G11; equations E3]: Verify exact Fremlin raw hash and native C++ time-series refinement; never infer real Euler solution
14. **S19** [G19; equations E3]: Regenerate 2015 parametric trefoils inside falsifier, hash-check vs pinned XYZ and original generator
15. **S20** [G20; equations E3]: Measure mean segment length divided by fixed regularization epsilon at each resolution without fitting
16. **S21** [G21; equations E3]: Test native C++ RK4 fine-mesh spatial convergence for regenerated trefoils at epsilon=0.06
17. **S22** [G22; equations E4, E5]: Verify precommitted finite-core analytic source
18. **S23** [G23; equations E4, E5]: Invert independently specified Gamma and Z
19. **S24** [G24; equations E4, E5]: Hold out vortex and pressure-gradient comparisons, no cutoff refit
20. **S25** [G25; equations E4, E5]: Test mapping nonuniqueness
21. **S26** [G26; equations E4, E5]: Verify native FP64 kernel parity
22. **S27** [G27; equations E4, E5]: Keep physical core unqualified without external vorticity cross section
23. **S28** [G28; equations E6, E7, E8]: Generate source-classified 3D surrogate and check solenoidal projection
24. **S29** [G29; equations E6, E7, E8]: Reject contaminated transverse sections
25. **S30** [G30; equations E6, E7, E8]: Invert Gamma/Z without velocity pressure fitting
26. **S31** [G31; equations E6, E7, E8]: Evaluate withheld dependent numerical u and pressure without retrospective calibration
27. **S32** [G32; equations E6, E7, E8]: Require upstream native Euler snapshot and independently computed physical holdout
28. **S33** [G33; equations E3]: Verify unmodified external A003 adapter implementation
29. **S34** [G34; equations E3]: Validate full A003 atlas source manifest and ALL 384 original XYZ records
30. **S35** [G35; equations E6, E7, E8]: Generate explicitly synthetic volumetric vortex from separately verified A003 Fourier trefoil and diagnose withheld velocity/pressure
31. **S36** [G36; equations E1, E2]: Do not promote geometric surrogate to physical source-native 3D Euler without independently qualified time-dependent field

7 Scientific algorithm

Verify three seals; compute controls; evaluate trefoil diagnostic.

8 Dataset provenance

D01 D02 D03, KnotPlot N300, external Fremlin and separate 2015 historical Fourier and torus geometric seeds. No historical geometry is physical PKLSA evidence.

9 Independent gates

G12-G14 remain historical tests; G15-G18 separately qualify direct N600-N4800 geometries and reduced ODE, independent of physical G3. No physical conclusions.

10 Numerical controls

Dimensionless finite-segment Biot-Savart and finite-difference derivatives.

11 Backend authority

CPU profile enables strict C++ gate; G3 may be evaluated but physical validation remains unresolved.

12 Blindness and integrity

All three dataset SHA256 seals checked; reveal comparator not used in blind kernel.

13 Statistics

Geometry subsamples are not independent upstream providers.

14 Result status

Read dynamic AUTO_RESULTS fragment; no target-matched force.

Automatic run provenance

Field	Recorded value
Run ID	20261019T144014838629Z-c3c0e44a
Run phase	BLIND
Protocol bundle SHA-256 (byte exact)	6231226fbe0c598ecd65d94af2915a4ff77858328cf4843f6b2d43ca780ac195
Portable protocol diagnostic SHA-256	6fb8ca45a5a01fafd761bffa1e84ae954905bcab5ad43f10fe95dd67c1ad0edc
Framework schema	SST-FALSIFIER-PROTOCOL-2
Python	3.14.3 (tags/v3.14.3:323c59a, Feb 3 2026, 16:04:56) [MSC v.1944 64 bit (AMD64)]
Platform	Windows-11-10.0.26300-SP0
Science evidence SHA-256	08d1c85588ca175e097b087b569b4e177cce08f6ad3838d2f5d9c9ee0e5e98ac
Final output manifest	See OUTPUT_MANIFEST.json (finalized after PDF and report metadata)

Gate ledger

Gate	Status	Question	Reason
G0	PASS	Is the frozen protocol intact and is the runtime self-consistent?	Frozen protocol verified by canonical framework.
G1	PASS	Are all preregistered sources present, identified and provenance-qualified?	Source bytes and single shared provider manifest verified; dynamic independence not implied.
G2	FAIL	Do reference numerics satisfy analytic/sanity and dimensional checks?	75/150/300 fixed-core validation. Retain historical FAIL; no tolerance changes.
G10	PASS	Does refined KnotPlot spatial RK4 filament discretization pass 150/300 and 300/600 with fixed epsilon?	Refined filament ODE only; 600 points interpolated from 300. Historic G2 FAIL retained.

G11	FAIL	Does authentic Fremlin C++17 provider satisfy source, spatial and time checks (simulation only)?	C++17 Fremlin numerical provider only, not an independent physical Euler model.
G12	PASS	Are historical Fourier and torus XYZ inputs hash-valid and analytically consistent?	Historical initial geometries verified, not dynamically relaxed PKLSA.
G13	FAIL	Do both historical geometries satisfy preregistered reduced filament ODE resolution and C++ Python parity?	G13 reduced filament ODE resolution only; any failure retained.
G14	PASS	Were epsilon sensitivity diagnostics recorded without fitting physical claims?	Only deterministic epsilon scan completion; not a physical closure.
G15	PASS	Are direct-analytic historical 600/1200/2400/4800 XYZ hash and nesting controls valid?	All direct parametric coordinate hashes and nesting verified; geometry only.
G16	PASS	Do BOTH historical trefoils meet 1 percent spatial convergence at baseline epsilon 0.12, 600 to 4800?	Fixed 1 percent baseline discretization threshold (not physical Euler).
G17	PASS	Are all three precommitted finite-core epsilon scans and complete 4800 point diagnostics recorded?	Epsilon scan completion only; individual failures retained, no physical core fit.
G18	PASS	Does native C++17 RK4 meet temporal convergence at 1200/4800 and Python spot parity?	Native time-convergence and limited Python parity; reduced ODE, not Euler PDE.
G19	PASS	Does the on-run analytic trefoil generator reproduce sealed XYZ and its arclength parameters?	Runtime 2015 analytical generation agrees with pinned XYZ; numerical initial data only.
G20	PASS	Are N-dependent segment-to-epsilon ratios computed and declared without fitting a physical core?	Resolution relative to numerical smoothing parameter measured, never optimized.
G21	PASS	Do fresh formula-generated N1200/2400/4800 trefoils converge at fixed epsilon 0.06 in native RK4?	Freshly generated N1200-N4800 geometry, fixed epsilon=.06, native C++ RK4; 600/1200 remains diagnostic.
G22	PASS	Do the synthetic finite-vorticity source invariants, preregistration and immutable legacy seals verify?	Legacy seals and synthetic analytic core inputs verified; not actual PKLSA.
G23	PASS	Can profile-conditional finite core width a be independently recovered from Gamma and cross-sectional enstrophy?	Recover profile-conditional a from independent Gamma,Z ONLY; synthetic positive/negative controls.
G24	FAIL	Does one slope-matched Rosenhead epsilon predict held-out swirl AND pressure-gradient fields within 5 percent?	FAIL is a scientific rejection of one fixed slope-matched Rosenhead cutoff reproducing the full finite-core profile; no retrofit.
G25	PASS	Do distinct legitimate kernel-equivalence mappings imply materially distinct epsilon values (nonuniqueness diagnostic)?	Multiple kernel matching definitions disagree; no universal epsilon inferred.
G26	PASS	Does an actually compiled C++17 FP64 radial-kernel path match Python, kernel-only?	Actual C++17 cross-sectional analytic kernel parity, not a vortex PDE solver.
G27	UNRESOLVED	Is a measured, independent full-PKLSA transverse vorticity core and separate held-out force/velocity provider qualified?	No authenticated real PKLSA transverse vorticity cross section or independent physical velocity/pressure provider. No SST r_c, Euler, Casimir or gravity claim.
G28	PASS	Is the generated 3D divergence-free vorticity and Poisson solver numerically consistent (synthetic only)?	Geometry-derived synthetic 3D source only; failed contaminated planes and heldout model predictions retained. NO native PKLSA Euler certification.
G29	FAIL	Are ALL local transverse stations free of cancelling flux and neighbour-strand contamination?	Geometry-derived synthetic 3D source only; failed contaminated planes and heldout model predictions retained. NO native PKLSA Euler certification.

G30	PASS	Can Gamma and Z on admissible stations determine a Gaussian-conditional core width without u/p fitting?	Geometry-derived synthetic 3D source only; failed contaminated planes and heldout model predictions retained. NO native PKLSA Euler certification.
G31	FAIL	Does no-fit Gaussian core prediction reproduce withheld dependent numerical velocity/pressure at 5 percent?	Geometry-derived synthetic 3D source only; failed contaminated planes and heldout model predictions retained. NO native PKLSA Euler certification.
G32	UNRESOLVED	Is a 3D dynamic PKLSA source plus INDEPENDENT u/p holdout fully proven?	True PKLSA finite-core time evolution and independent velocity/ pressure targets unavailable.
G33	PASS	Does the external A003 v0.2.3 adapter match its pinned, unmodified release hashes?	Original A003 source and release metadata SHA256 verified; no code vendoring
G34	PASS	Does the original A003 v0.1.2 atlas pass adapter v0.2.3 full geometry and hash audit?	Real A003 adapter validated all original atlas records; geometry only
G35	FAIL	What is the Gaussian surrogate 3D velocity pressure and transverse core behavior of a verified A003 Fourier trefoil?	Explicit Gaussian synthetic core diagnostics on original A003 3_1 seeds; independent physical targets NOT supplied
G36	UNRESOLVED	Is there independent source-native 3D Euler PKLSA time evolution and heldout physical pressure?	No independent time-evolved source-native 3D Euler vorticity AND physically independent pressure/velocity holdout. A003 geometric atlas cannot supply them.
G5	PASS	Does actual C++17 FP64 filament velocity match Python at 75/150/300? Kernel-only evidence, not full solver certification.	Actual C++17 kernel executed. Full scientific/backend certification remains open.
G3	UNRESOLVED	Does target-free discovery reject the preregistered null under the registered statistic?	G3 evaluated after refined numerical qualification; independent physical force, complete Euler dynamics and microscopic material response remain unestablished.
G4	UNRESOLVED	Does an independent held-out/ provenance-family confirmation reproduce the discovery result?	No independent physical heldout; diagnostic attempted without overriding G3.
G6	NOT_APPLICABLE	If enabled, does GPU screening pass CPU to GPU parity without being promoted beyond its registered authority?	Disabled for CPU-only profile
G7	NOT_APPLICABLE	Does the result replicate across preregistered source families/encodings without pseudo-replication?	Disabled for CPU-only profile
G8	UNRESOLVED	Are physical PKLSA Euler, material, surface and independent-provider closure requirements met?	No material surface, independent full Euler or PKLSA dynamics. Diagnostic-only.
G9	DEFERRED	After all blind gates, does reveal verification match the preregistered commitment and permit target comparison?	Reveal is a separate, commitment-verified phase and is not executed during blind runs.
